

Narrative report Denmark 2013-2014

The epidemiological HIV-situation in Denmark has been stable over the last many years. We don't see any increase in yearly reported cases among MSM or any other groups as seen in other European countries. Prevalence of HIV in affected communities like MSM and IDU's is estimated to about 5%.

Funding of preventive and counselling services carried out by the Ngo's have not declined in 2013 and 14 (but cuts are expected in 2015).

Expenditures to HIV-treatment are not centrally registered, as this is taken care of by the regional health care system.

Detailed information of treatment of HIV+ is collected by hospitals/doctors outside the knowledge of the health authorities.

HIV-related stigma is considered low.

We have no recent data about knowledge/attitude/behaviour among any population groups.
